

#### Unleashing the Agents: From a Descriptive to an Explanatory Perspective in Agent-based Modelling

Christopher K. Frantz <u>christopher.frantz@ntnu.no</u>

Social Simulation Conference 2018 20<sup>th</sup>-24<sup>th</sup> August 2018 Stockholm

## The things we do ...

- Agent-based Modelling
  - Complexity
  - Human Metaphor

Images:

http://sethsays.org/index.php/2016/08/26/cooperation-beats-competition-pun-intended-seth-explains-why-part-3/2 https://aspergerhuman.wordpress.com/2017/01/14/social-conflict-makes-me-ill/

### ... when we model ...

- Realistic representation of *scenario* important
- But what about the *agents*?

## Question

- Can we endow our «pseudo humans» with (at least) «pseudo-reflective» ability?
- Motto: «Don't tell me what you are doing; tell my why you are doing it.»
- $\rightarrow$  1. Development Process
- $\rightarrow$  2. Evaluation

## **Development Process**

- Verification
  - Step-by-step verification
- Standard Debugging/Inspection Tools?
  - State inspections (e.g. variables)
  - Suggestion: mental reconstruction of narrative from states
- While states are helpful, narratives are preferrable.
  - Letting the agents explain what (they think) is happening

## **Evaluation**

- Temptation to focus on aggregate metrics
- Closing the micro-macro link of analysis
- Uniform and accessible exploration across all levels of social organisation

## Challenges

- Minimal set of human abilities necessary?
- Representation?

## **Fundamental (Human) Abilities?**

- Deliberation (reasoning)
- Abstraction (complex language, social constructions)
- Empathy (perspective taking)
- Social learning, referencing
- Experiential learning
- Implicit social cognition (stereotyping)

Suggestion: (Social) *Institutions* as lowest common denominator of any society

## **Fundamental (Human) Abilities?**

Deliberation (reasoning)
 Abstraction (complex language, social constructions)
 Empathy (perspective taking)
 Social learning, referencing
 Experiential learning
 Implicit social cognition (stereotyping)

Suggestion: (Social) *Institutions* as lowest common denominator of any society

# Institutions ('Manifestations of Social Behaviour')

#### Conventions (Descriptive Norms)

- Describe observable behaviour
- «Drivers drive on the right side of the road.»

#### Social Norms (Injunctive Norms)

- Describe obligations, permissions, prohibitions
- Socially enforced
- «Drivers must stop at zebra crossing if encountering pedestrians.»
- Rules (Laws)
  - Formalised, centrally enforced
  - Traffic law: «Drivers must stop at zebra crossing, or else they face fines.»

## **Institutional Grammar: Nested ADICO**

Frantz et al., 2013/2015; Extension of original 'Grammar of Institutions' by Crawford and Ostrom, 1995

Symbols	Α	D	I.	C	0
Semantics	Attributes	Deontic	Aim	Conditions	Or else
Pragmatic use	Actor	Duty	Action	Context	Sanction
				1	

• Institution Types:

Spatial, temporal, procedural

AIC (Conventions)

- Drivers (A) drive on the same side (I) of the road (C).

- ADICO (Norms/Rules)
  - Drivers (A) must (D) drive on the same side (I) of the road (C),
     or else drivers (A) may (D) cause accidents (I).\*

→ Structure: ADIC(ADIC)

**Consequential statement** 

**Monitored statement** 

\* If unspecified, (C) resolves to 'at all places, at all times'.

## **Nesting Principles**

- Agents observe their social environment and collect observations (& feedback), and generalise those.
- Inference of *desirable actions* based on feedback

- Agents observe their social environment and collect observations (& feedback), and generalise those.
- Inference of *desirable actions* based on feedback

- Agents observe their social environment and collect observations (& feedback), and generalise those.
- Inference of *desirable actions* based on feedback

```
aic(attributes(*, Seller), aim(trade, goods), *), 14
aic(attributes(*, Seller), aim(embezzle, goods), *), -3
```

- Agents observe their social environment and collect observations (& feedback), and generalise those.
- Inference of *desirable actions* based on feedback

#### Generating Injunctive Norms

- Action 1 (previous action)
- $\rightarrow$  Mapping to ADIC(ADIC or ADIC) :
- nadico(adic(attributes(\*, Producer), should (11), aim(send, goods), \*),
  - orElse(
    - adic(attributes(\*, Seller), will not, aim(trade, goods), \*)
       or
    - adic(attributes(\*, Seller), will not, aim(embezzle, goods),
       \*))
- → Details: Frantz et al. (2015): <u>Modelling Dynamic Normative Understanding in Agent Sociețies</u>. Scalable Computing: Practice and Experience, vol. 16, no. 4, pp. 355-378

- Performed in real time
- For each agent

## Experiment

- Corruption Game Cooperation game of moderate complexity; variation of double-sided metanorms game
- Stylised interaction between citizens and enforcement personnel (monitoring and punishing transgressions)
- Third party monitoring and appeals process
  - Enforcers monitor citizens, and are monitored themselves
  - Representation of Structural Institutional Regress

Feedback Syntax: [*citizen*[,1stOfficial[,2ndOfficial]]];  $C \rightarrow Cooperate; V \rightarrow Violate$ 

#### **Parameters**

Parameter	Value Range and Step Size
Number of Citizens	25 - 75; step size: 25
Number of Officials	25 - 75; step size: 25
Exploration Probability	0.1
Cheater Fraction	0.3 - 0.7; step size: 0.2
Cheating Probability	0.5  (fixed)
Weight for Observations	0.5  (fixed)
Memory Length	100  (fixed)

# Correlation between parameters and cooperation decisions

Parameter	COOPERATE	VIOLATE	INACTIVE
Number of Citizens	0.22	0.25	0.51
Number of Officials	0.36	0.55	0
Quota of Cheating Citizens	-0.3	0.45	0
Social Learning	-0.03	0.03	-0.25
Social Learning Separated by Role	0.32	-0.22	-0.35
Ignoring Actions	-0.38	0.36	0.51
Appealing	0.33	-0.14	-0.33

# Drilling down: Correlation between statement inference and role-separated social learning

Index	Statement	Correlation
<sup>1</sup> +	OFFICIAL: REJECT_APPEAL – CITIZEN: APPEAL – OFFICIAL: SANCTION – CITIZEN: VIOLATE	0.38
<sup>2</sup> O	CITIZEN: ACCEPT – OFFICIAL: IGNORE – CITIZEN: APPEAL – OF- FICIAL: SANCTION – CITIZEN: VIOLATE	0.25
3	OFFICIAL: GRANT_APPEAL – CITIZEN: APPEAL – OFFICIAL: SANCTION – CITIZEN: VIOLATE	0.25
4 🕇	CITIZEN: ACCEPT – OFFICIAL: REWARD – CITIZEN: COOPERATE	0.38
5	CITIZEN: ACCEPT – OFFICIAL: IGNORE – CITIZEN: APPEAL – OF- FICIAL: IGNORE – CITIZEN: COOPERATE	0.26
6	OFFICIAL: REJECT_APPEAL – CITIZEN: APPEAL – OFFICIAL: IG- NORE – CITIZEN: COOPERATE	0.26
7 +	OFFICIAL: GRANT_APPEAL – CITIZEN: APPEAL – OFFICIAL: IG- NORE – CITIZEN: APPEAL – OFFICIAL: SANCTION – CITIZEN: COOPERATE	0.13
8	OFFICIAL: REJECT_APPEAL – CITIZEN: APPEAL – OFFICIAL: SANCTION – CITIZEN: COOPERATE	0.26
<sup>9</sup> +	OFFICIAL: GRANT_APPEAL – CITIZEN: APPEAL – OFFICIAL: SANCTION – CITIZEN: COOPERATE	0.23
10	CITIZEN: IGNORE	-0.35

### **Micro-level Statements**

A=A(\*, {ROLE=[CITIZEN]}), D=3.0, I=I(APPEAL, \*), C=C({PREVIOUS\_ACTION=L0: A=A(\*, {ROLE=[OFFICIAL]}), I=I(SANCTION, \*), C=C({PREVIOUS\_ACTION=L0: A=A(\*, {ROLE=[CITIZEN]}), I=I(VIOLATE, \*), C=C(\*), O=(null)}), O=(null)}), O=(L1: A=A(\*, {ROLE=[OFFICIAL]}), D=-3.0 (inv), I=I(GRANT\_APPEAL, \*), C=C(\*), O=(null))

A=A(\*, {ROLE=[CITIZEN]}), D=-1.0, I=I(APPEAL, \*), C=C({PREVIOUS\_ACTION=L0: A=A(\*, {ROLE=[OFFICIAL]}), I=I(SANCTION, \*), C=C({PREVIOUS\_ACTION=L0: A=A(\*, {ROLE=[CITIZEN]}), I=I(VIOLATE, \*), C=C(\*), O=(null)}), O=(null)}), O=(L1: A=A(\*, {ROLE=[OFFICIAL]}), D=1.0 (inv), I=I(REJECT\_APPEAL, \*), C=C(\*), O=(null))

A=A(\*, {ROLE=[CITIZEN]}), D=-0.5, I=I(APPEAL, \*), C=C({PREVIOUS\_ACTION=L0: A=A(\*, {ROLE=[OFFICIAL]}), I=I(REWARD, \*), C=C({PREVIOUS\_ACTION=L0: A=A(\*, {ROLE=[CITIZEN]}), I=I(VIOLATE, \*), C=C(\*), O=(null)}), O=(null)}), O=(L1: A=A(\*, {ROLE=[OFFICIAL]}), D=0.5 (inv), I=I(REJECT\_APPEAL, \*), C=C(\*), O=(null))

A=A(\*, {ROLE=[CITIZEN]}), D=0.5, I=I(<u>APPEAL</u>, \*), C=C({PREVIOUS\_ACTION=L0: A=A(\*, {ROLE=[OFFICIAL]}), I=I(<u>REWARD</u>, \*), C=C({PREVIOUS\_ACTION=L0: A=A(\*, {ROLE=[CITIZEN]}), I=I(<u>COOPERATE</u>, \*), C=C(\*), O=(null)}), O=(null)}), O=(L1: A=A(\*, {ROLE=[OFFICIAL]}), D=-0.5 (inv), I=I(GRANT\_APPEAL, \*), C=C(\*), O=(null))

# Summary

- Leveraging agents to explain scenarios
  - «Institutional narratives»
- Drilling across all levels of social organisation
  - Micro, meso, macro
- Generic approach
  - Identify attributes (social markers), actions, feedback
- Use cases
  - «Cheap deliberation»  $\rightarrow$  injection of results into decision-making
    - Intrusive
  - Inspection of scenario from agent perspective
    - Non-intrusive

## **Challenges & Outlook**

- Readability
- Performance (Memory)
- Explore application in policy analysis
- Provision as plug-in
